INTRODUCTION

Welcome to the journey to play your best golf ever. The tips and drills in this E-book will guarantee you get your handicap down and become better than ever. You'll learn what I've learned after years of training and learning from some of the best coaches in the world. These are the drills I've been doing continually for the past few years to get my handicap from **2 to +5**, and they are what I'll continue to be doing on my path to becoming a pro golfer.

If you are like 99% of golfers, you have been approaching the game completely wrong. Spending hours upon hours trying to figure out the game, spending thousands upon thousands on lessons and the newest equipment, yet not seeing a difference. Fix that with the drills in this book.

Enjoy your read & good luck!

Play Golf, Not Swing

Golf has quite possibly become the most overexplained but underdeveloped sport in the world. We are stuck playing golf swing, instead of training to play golf. Once I flipped the switch and understood what to do as an alternative, my game changed overnight:

This pretty backswing you're working on? The golf ball doesn't really care about it. How you grip it? The golf ball doesn't care. How you're feeling? The golf ball doesn't care. The golf ball doesn't respond to how tall you are, how much you weigh, whether you are 15 years old or 75 years old, whether you picked up a club for the first time yesterday or have been playing for 30 years. It simply doesn't care. What does it care about? **Impact**.

We're not talking about how your body is positioned at impact. No, all a golf ball cares about is the point of collision with the clubhead. During that time, and only during that time, does the ball care about the information it's been given. It's literally all it needs to determine where it will be going and with what trajectory (wind excluded).

Where was the clubface pointing? Where was the path of the club? What was the difference between the path and face? Did the club hit the ball first, or turf? And by how much? Where did it get struck on the clubface? What speed was the clubhead going?

The real lasting improvements will come when you develop a conscious awareness of why the ball did what it did, and how to change it in the right direction. Develop an increased understanding of what is and should be going on at impact. From path & face contributions, to start direction, to how off-center strikes can change ball flight. From there, you need to develop an awareness of what to change when you see a ball flight that is unsatisfactory, as well as how to change it to get the desired one.

If you do not fully understand what you are doing with the tool in your hands to create the shots you are creating, any lesson or practice session you have will be useless and short-lived. By improving your understanding, ability to identify and rectify issues AND improving the processes by which you learn, you'll see improvements that will stay with you for life.

"Give a man a fish, and you feed him for a day. Teach a man to fish, and you feed him for a lifetime."

The Performance Matrix

No golf pro ever got paid for having a pretty golf swing. The main objective of the game is to perform. To get to greater heights you must master the aspect of score. Your practice should be designed in a way that there is a high probability you will perform better on the golf course. For that to happen, you need to be absolutely sure that the information you're using is the perfect match for your particular puzzle.

Are you addicted to fixing your swing? Or are you addicted to focusing on the areas that will lower your scores?

Instead of hammering on swing changes because of a recent YouTube video you've watched or because you've seen last weeks Tour winner do a drill, you need to work your way to improvement by looking at the game from an actual performance standpoint:

Performance Factors	**Ball Flight Laws**	**Impact Laws**
1. Increased max distance	1. Startline	1. Face strike (club/ball)
2. Distance control	2. Launch angle	2. Ground contact
3. Directional control	3. Ball speed	3. Face direction (left/right)
4. Trajectory	4. Spin axis	4. Swing path
	5. Spin rate	5. Club speed
		6. Angle of attack
		7. Dynamic loft

Start off by looking at the first block: **performance factors**. What part of your game needs to get better?

When you find the actual performance parameter that you wish to improve, you can reflect backward to the **ball flight laws (row 2)** that need to change in order to achieve these improvements. If we know one of these is off, we can then relate it back to the **impact laws (row 3)** that are the sum of that ball flight law. Only then can you decide on what to work on.

This is the process you need to understand, if you want to work on your game 'the right way'. It may seem complicated now, but with a bit of understanding - the puzzle will finally seem solvable!

PRACTICE

So, let's dive into the practice side of things! We're going to separate the game into four boxes:

Long game	Approach shots	Short game	Putting

These four are the physical elements of the game. These four entail the full spectrum of golf drills, besides mental game etc. With each of these having its own challenges and aspects to improve on:

Long game:
- Tee-shots/driving
- 200m+
- 180-200m
- 160-180m
- 140-160m
- 120-140m
- Trouble shots

Approach shots:
- 100-120m
- 90-100m
- 80-90m
- 70-80m
- 60-70m
- 50-60m
- 40-50m
- 30-40m

Short game:
- Bump and run
- Pitch shots
- Lob shots
- Flop shots
- Bunkershots
- Trouble shots around the green

Putting:
- Long putts (>30ft)
- Mid-length putts (10-30ft)
- Short putts (<10ft)

Train to Play

How to improve at these four boxes of golf? In a video game, attention can be drawn to the screen, the buttons, or the nuanced technique of ‘how to press the button’. Likewise, in golf, one can fixate on the target, impact, or the intricacies of ‘how to make a golf swing’

Much like focusing solely on the screen in a video game without understanding the controller buttons’ functions will be tough, honing in on the golf swing without understanding what happens when the ball meets the club at impact remains suboptimal.

Understanding and training to improve this impact part is like knowing and controlling what each button on the controller does - it’s crucial for success! So that’s what we’re going to be adding.

Instead of just focusing on how to swing or fix technical issues, your approach from now on will cover three areas: technique (method of pressing buttons), skill (understanding & controlling the buttons), and performance (the ultimate goal or outcome).

What is technique?

Technique is simply the procedure that’s being used to complete a task. Such as a full shoulder turn in the backswing, a neutral grip, or a steep or shallow swingplane. There are endless options. Tiger Woods uses a different method (technique) than Rory McIlroy. Everyone on tour has a different looking swing.

What’s the problem with solely looking at technique for improvement? All good players have the ball position in roughly the same spot, have forward shaft lean, use the pivot of the body etc. But these technical aspects, alone, won’t make you a good ball striker. You could give a complete beginner the perfect set-up and swing, one which would not look strange on tour - and they would still hit it all over the place. Give Tiger Woods the worst set-up position, and he will make it work. That’s where the difference lies.

What is skill?

Can you hit the middle of the sweet spot with a square face? Can you strike the ground in the correct spot? Can you hit it inside 5ft of the flag with a low, mid, and high ballflight? Can you hit a draw and a fade to the same target? Can you present the face more open or closed at impact? Everyone could do these things to a certain degree, but different skill levels can do so with different levels of precision. Currently, if I try to present the face 2 degrees open or closed at impact, I can get within 1 degree on either side of that most of the time. This used to be different. I wasn’t able to control the clubface this well. While my swing (technique) looks fairly similar compared to before, the results aren’t the same.

The issue is: we don’t see skill levels on camera, which is why many instructors and golfers overlook this area.

A more skilled player is adaptable to any circumstance. Place them in a divot and they'll outperform a lesser skilled player. Ball above feet, they'll outperform a lesser skilled player. Aim Tiger Woods 50 meters right of target and ask him to get it back onto the fairway, he'll hit those shots! If you want to improve faster, would it be a good idea to skip this type of training?

What is performance?

During performance training, you are testing your abilities. Here we don't focus on technical improvements or skill development, but on testing where our current abilities lie. Testing various variables to identify what works best for you. A simple example is setting a test where you hit 10 shots from a certain distance to a certain target, marking the average proximity to the hole afterward.

Test yourself with different ball flights: which one works best? Test yourself with different swingthoughts. Which one helps you score lower?

Everyone must go through times of pushing boundaries, to challenge oneself and find different areas to improve at. But also go through periods of testing and maximizing what we currently own.

Time to go to work

September 2026: I've spent the past 6 months working on a practice community where you'll learn all the lessons you need on how to develop your game to new heights as fast as possible.

Inside of **The Practice HQ** you'll find:

- Swing lessons built around improving your impact & ball flight
- Scoring strategies and masterclasses for every part of the game
- Training programs and challenges with a community of likeminded golfers
- 1:1 support from me directly

Everything is set up for just one goal: **lowering your handicap faster.**

PS: Only available to those that have read the practice programs.

LONG GAME

Technique

To build a more consistent swing, you want to dial in your technique - **individual tendencies** will go beyond the scope of this book (you'll find them in the **Practice HQ**). Below, you'll find the most important lessons, tips, and drills I've learned in the past 15 years about doing it correctly:

First off, only make a change when you're aware of exactly what **impact factor** you want to improve. Once you know what parts of your movement you need to work on to create a positive effect on your ability to control impact, you can go about changing it. If you train your technique, learn to forget about the outcome - it is just making you lose focus from improving your movement pattern. It sounds contradictory since we make swing changes to hit better shots, but at the start, this is just not what will happen due to a complete overhaul in your movement pattern. Movement changes take time and effort. Once ingrained - they will lead to consistently better outcomes. But the more you're distracted from the change you want to make, the longer it will take before you're fully there.

How to go about making a swing change?

- **Understanding**: every swing change should start with developing a complete understanding of why and what you're doing. Why do you make the change? To look prettier? Or to improve an aspect from ***The Performance Matrix***? Ask questions to your coach, and work on developing that understanding before moving on to anything else.
- **Exaggeration drills**: exaggerate the desired movement. Imagine someone has a gun to your head if you don't get it done. Then focus on making the change. How hard would you try? That's the type of intensity you should bring. Over and over again.
- **Slow Motion drills**: bring in the desired movement, by slowly going through the motions. No stopping in the swing, just slow continued movement. Then slowly pick up the speed: 20% swings, 40% swings, 60% swings, 80% swings, and full swings.
- **Record your swing**: check up on yourself. Record. Check-up again, exaggerate more. Record. Check-up. Feel the movement and then look at how feel/real aren't the same. That's the reason we exaggerate! Feeling a tiny change will barely make a difference!
- **Specific drills** for your movement-related changes: ask a coach who has a good understanding of the game – to get you sorted technically.
- **Training aids**: use a training aid (that is useful for your specific situation) as a constraint and a visual to make your practice more instinctive. Responding to objects to help get you where you want, instead of thinking thoughts all the time. Less thinking = good! Further in, you'll find some of my favourite training aids for different parts of the game.

UPDATE: I've partnered up with **Tour Swing**. To make sure you have high-quality and effective training aids available that actually have a positive effect on your game. For your bonus discount, use code: **DANEGOLF10**.

When making a change: if it doesn't feel strange, you're not changing it enough.

Swing

Even though we are all built different, and shouldn't compare positions/swings etc. Here are a few technical tips I've learned over the years that changed my game for the better, and that I know will help you too:

1) **Hipline in set-up**: besides spending a few years studying the best in the game, I've also gone through giving a fair share of lessons and helping others improve. One of the things that always stands out is the set-up. Specifically, the balance points and hipline in set-up. Most amateurs set themselves up with the hipbone on the **heel line** or even behind the heel line (left picture), making rotation more difficult and less optimal. These are usually the players who struggle with early extending as well. What I want you to try instead, is to set up with your hipline **on top of your ankles** (right picture). Like the best in the game do, too. Make sure you start the swing off from the most stable place, for effortless power.

VS

From where do you think you could create a more powerful move?

What about Tiger Woods, Rory McIlroy, and Ludvig Åberg?

2) **Tilt in set-up:** an important bit that I still see many golfers do wrong, is the spine tilt in set-up. With a forward ball position (to make sure we hit up on the ball) many golfers try to 'reach' to the ball by opening up their shoulders and forearms, which promotes more of a cutting action across the ball and a lot of spin on the ball. This won't help much if one wants to hit it as far and straight as possible. Make sure that instead of 'reaching' to get the club to the ball, you 'tilt' the spine away from your target.

Grab a shaft and hold it alongside your spine (as shown above). Bend forward into your golf posture, then tilt the spine until the shaft touches the inner thigh of your lead leg. That's the correct amount of spine tilt to hit the drives long and straight! With a vertical spine - and 'reaching' for the ball (opening the shoulders & forearms) you'll be more inclined to hit down on the ball and move too far out-to-in. Setting up correctly is key!

3) **Forearm width**: keep your forearms the same width from set up, to the top of the backswing. This will ensure you have proper armstructure, which will put the club in a better position at the top. Too many golfers have that flying elbow, getting the arms disconnected from the body, and have to compensate after. A great feel is to simply keep the distance in your forearms the same! Use the **Impact ball** or **connection band** between your forearms as a drill. It's a great way to practice staying connected for a more reliable swing.

4) **Stay in posture:** train yourself to stay “in your posture”. Improving your dynamic posture (posture while turning) will have a massive impact on your game. The visual is your shoulders simply turning up & down in a tilted letter “T”. The lower part being your spine (on a tilted angle), the upper part being your shoulders. Turning around a stable spine angle will ensure you maintain more consistent impact, as it’ll promote more stability and consistency in your movement.

   The feel I’ve always liked is to imagine my body being “stuck” inside of a barrel/bottle that suits my body perfectly, while I keep my head “on a wall”. Giving your mind the image of having to twist back and through within that barrel, while keeping your head glued in place, instead of knocking too much sideways or up/down, will definitely help with moving in a more functional manner. It doesn’t mean you want to be rigid, you’re still coiling up, loading down, rotating through explosively. But around that stable centerpoint!

Can you keep your head and butt line on these lines until about impact?

5) **Hit up on the ball**: many golfers struggle to hit up on the ball. Instead they’re creating spinning ball flights that don’t go as far as they potentially could. The simplest drill, especially for players that tend to slice it, is to simply put a headcover in front of the ball. Try to swing over the right side (for right-handed players) of the headcover, to create a more in-to-out clubpath and better strikes. Give the brain the task to swing up on it more by avoiding hitting the headcover. Making sure you have a positive angle of attack will give you more carry distance, and less spin, so you can optimize the distance your shots travel and have shorter shots in!

Skill:

This part is key. And it's what's neglected by the majority of golfers (coaches included). We like to change swings since there's an instant visual outcome. It either looks different, or it doesn't. You see coaches post "before" and "after" swings of their students all the time, being all proud of the changes made. But in a way, it's completely irrelevant. The ONLY thing that actually matters isn't how it looks. It's the scorecard. Did you actually score lower? For what other reason would you make a change?

If you want your game to improve for the better, implement skill drills into your game. The thing you cannot see when looking at a swing on a camera, but what you'll feel when being out on the golfcourse:

1. **5 gears drill:** hit 5 drives in 5 different tempos. Like the 5 gears in your car, learn to "drive" in the 5 gears of the golf swing: 20%, 40%, 60%, 80%, 100% swings. Do this for 5 sets of 5, to improve your overall feeling in the swing. Feeling the club in different tempos while trying to hit "good shots", hitting the sweet spot and hitting it somewhat straight, will improve the swing in the tempo you play in like no other! It's extremely effective. Do it for a few weeks, and notice how straight you'll be hitting it!

2. **Driver/wedge**: switch hitting a full drive, with hitting a smooth wedge shot. Allow the soft tempo from the smooth wedge shot to be filtered into your driver swing. Learning to swing it, instead of "hit it", needs to be practiced!

3. **Face strike drill:** get a whiteboard marker pen and draw a little dot on the ball. Set it up opposite to the target (to the side where club contacts the ball), and hit the shot. Then check on the mark to see where you're hitting the ball on the clubface. No one seems to train it, while it's the most important thing in the game. Especially with the driver. Feel the middle and build awareness around exactly where that middle is. To improve your skill levels even more: start the swing off with the clubhead set behind the toe or the heel of the club, and then try to re-route it back to the sweetspot. Bonus: draw a little circle on the sweetspot of the club and fill it up with center strikes).

4. **Startline drill**: Set up two alignment sticks into the ground about 20ft ahead of you - 3ft apart, as to where the target line goes right through the middle of the gap (make the gap narrower/wider depending on current abilities).

Focus on just startline at first. Start it right of the right stick, on the right stick, in the middle, on the left stick, and left of the left stick, all while aiming through the middle. How? By opening and closing the clubface at impact. Get a feel for where that clubface is at, develop the understanding of what happens when you come through the ball a certain way, and become aware of the feels you need to have to open and close the clubface ever so slightly. The better you'll feel the clubface's aim at impact, the better your overall game will be. So train it!

If you have a launch monitor available, training to hit different degrees of opening and closing the clubface at impact will improve this feel even further. Can you get to within 1 degree of what you wanted it to be? Can you open the clubface anywhere between zero to 3 degrees, and close it too? Control the clubface, and you'll control the game of golf!

One simple hack that I learned from my coach a few years back is to visualize a **nail** (the one you hammer into a wall) angled through the ball. Your job is to angle the nail towards where you want to start the ball - usually the target - and hammer it with a square clubface! It gives the brain a clear task, and stops the 'internal checklist golf'.

5. **Advanced startline drill**: Same as above, but can you start it on the right alignment stick, through the middle, on the left alignment stick, all while finishing up **in the same target zone**? This is the drill that I did time and time again. Practicing hitting different ballflights to the same target will bring in a sense of control you haven't felt before.

Performance:

What is performance?

During performance training, you are testing your abilities. Here we don't focus on technical improvements or skill development, but on testing where our current abilities lie. Testing various variables to identify what works best. A simple example: hit 10 shots from a certain distance to a certain target, marking the average proximity to the hole afterward. Test yourself with different ball flights: which one works best? Everyone must go through times of pushing boundaries, to challenge oneself and find different areas to improve at. But also go through periods of testing and maximizing what we currently own.

On to testing your abilities! Mimicking an on-course scenario in your practice sessions will train you to bring your 'range game' to the course. How are you expecting to get good results, if you never train yourself in a test-like scenario?

1. **7/10 fairway drill**: hit 10 drives to a pre-determined zone (depending on your abilities).
    - 36 hcp: 25m left/25m right
    - 20-30 hcp: 22.5m left/22.5m right
    - 10-20 hcp: 20m left/20m right
    - 5-10 hcp: 17.5m left/17.5m right
    - 0-5 hcp: 15m left/15m right
    - <0 hcp: 12.5m left/12.5m right

    The aim of the drill is to hit seven out of ten drives within the zone to pass the challenge. Anything under that and you'll have to start over! Passed the challenge? Make that zone a bit smaller and try to lower to the next level. How sharp can you become?

    Try factoring in different ball flights, such as a fade or a draw. Or try factoring in different swing thoughts (read more in "My 10 biggest golf hacks"). What gives you the best outcome? Figure out your blueprint to success!

2. **5 ball driving game**: Pick a zone on the range that's good for your level of play (see zones above). You're going to try and hit 5 drives into this target. If you miss at any point, you're going to make a putt (4-5-6 ft depending on level) to either stay on the number that you're at – or start over from scratch. The goal is to finish the drill by ending up at the 5 shots into the zone. It might take a while (set a 15 minute timer if you're in a rush and see how far you've gotten). Do this with different ball flights to find what works best for you.

    Advanced version: As a side-challenge you could also pick a side of the target that is out of bounds, if you miss the target on this side at any point in time you start over completely. If you miss the target on the opposite side (less punishing side) you stay on the number that you're at and try to hole the putt. Do this drill for the driver, 3 wood, and long iron.

On-course games

1. **Tee the ball up on the fairway:** at driver distance from the hole. Play it as a par 3. Do this for 9 holes (exclude the par 3's). And see what you score. Hitting a driver to a flag and green will do wonders for your game. The fairway will seem huge…

2. **Two ball worst ball off the tee**: play your regular 9 holes, but play 2 shots off the tee on every hole. Continue with the worst of these two and play out with that ball, so you only play worst ball off the teebox. Can you still score? It's a great test for your teeshots!

Pro tip: mix short technical sessions within your skill and performance drills. For example, split a performance drill up with 10 shots of technical work to keep the technical feels alive. And to get your mind off the visualization that you'd be doing in the performance drills. Get in touch with the feels you want to implement. Then get back into performing!

Routine:

The last part of the driver practice part is your routine. We all know that what we think affects our play, but how often do you work on it? How often do you practice “thinking better”?

5 sets of 3 balls

First 3: pick a target on the range, now **zoom in** as much as possible to that target. Not just “that tree” but instead “that leaf on that branch of that tree”. Zoom in and look at nothing but that target. Your eyes won’t go anywhere else, your feels won’t go anywhere else, nothing matters but that small leaf. And your ball going there.

Next 3: you’re going to hit the shot to that smallest target - now add your commitment levels and try to get them at a 100%. **Full commitment**. No holding back in any mental sense. Everything in your mind is set to hit it to that target and nothing else matters. You’re only committed to that. Not to doubting your set-up or whatever, full commitment to your swingfeel, and a positive outcome. All in.

Last 3: you’re going to hit the shot to a smallest target - with 100% commitment levels - and add a **complete acceptance** to anything and everything that could happen. Being completely cool with wherever this ball is going to go, you do not care about missing since you already accepted it. You’re cool with whatever happens, so you can relax into only caring about hitting it to your target. Bringing a level of acceptance to your shot will bring an extra sense of commitment into your game. You’re swinging free, instead of “steery”.

IRON PLAY

Technique

I have been through my fair share of technical drills, but these four are my absolute favorite:

1) **Swingplane**: to build a consistent swing, you must groove a consistent path. If you're like most golfers, you either swing too over-the-top, or too in-to-out (like I tend to do). Many ways to train either one. But the best way to practice it, is with an external tool such as alignment stick into a range bucket, or with a **Swing Plane Trainer**. To fix a hook-miss, set it up like image 1 or 2. If you're more of a slicer, set it up like image 3 or 4. Very simple drills, but extremely effective. Example video: **WATCH (5 & 6)**

2) **Anti-early extension**: set up an object against your butt and try to keep yourself against that object until about impact. Again, to 'maintain your angles' better! Learning to swing around a stable spine angle will instantly give you more consistent outcomes. Keep that right hip back for longer, while pulling the left hip back and out of the way - then turn!

3) **Elastic band around knees**: for a more engaged lower body, putting an elastic band (mini band) around your knees is a great drill/feel. Bring that same feel to your actual swing and you'll instantly feel more stable in your movement.

4) **Swing inside of a barrel/bottle**: again, a great feel to make sure your body stays more "on top" of the ball is to imagine your torso being stuck inside a barrel that suits your body perfectly. Your head will stay more stable, and your low point control will be much more consistent since you're operating in narrower margins! Less moving side to side but more so turning around one stable center point may help you out with your strikes!

- Work on your drills in **3 sets of 5 balls**.
    - First 5: exaggerated feels.
    - Next 5: use your swingfeels in different tempos.
    - Last 5: trainingaid. Use a specific trainingaid or swingdrill for this block.

Skill:

1. **Face strike drill:** grab two alignment sticks and set them just wider than a clubhead apart. You'll be working on strike and clubpath in one! Feel the middle/sweetspot and build awareness around exactly where that middle is. To improve your skill: start the swing off with the clubhead set behind the front stick, and re-route it back to the middle. Then start it off at the back stick, and re-route it back to the sweetspot!

2. **Ground contact:** Get in a fairway bunker. Draw a line in the sand. Now hit that line with the divot starting right on it! Test yourself: can you make good contact from different ball positions, using different clubs? Can you hit the line with a deep divot, then hitting the line with a very shallow divot - sprinkling a few grains of sand away?

3. **Face angle:** Here you'll see Wyndham Clark executing my favorite face direction drill. Start it over ball 1-2-3 left or right, and get it back into your target zone. All the best players train like this to improve their feels, why don't you?

4. **Advanced:** Tiger Woods' 9 ball drill. Hit a fade, draw, and straight shot. Hit them high, medium, and low. Can you hit a low draw to a predetermined zone? Can you hit a high fade to the same zone? You can do this by changing your set-up, so aiming more left or right with your feet and shoulders, or by just changing your swing path through feel. Challenge yourself with different clubs! And try to get 6/9 inside of your zone to pass the challenge. Anything below? Go again!

Human skill drills:

You need to work on the **BTT** (Balance, Tempo, Tension) drills. They work great for driver too. Training yourself to be aware of what your body is doing! We all know that making tensed swings, or losing balance, tends to affect the outcome of a shot - so don't these drills below. Even if it's for 15 minutes a week, paying attention to these aspects will help you out.

1. **Balance:**
    - Make swings barefoot (must do)
    - Make swings with right arm only, while standing on left leg only (to challenge balance)
    - Make swings with left arm only, while standing on right leg only (to challenge balance)
    - Make swings with your eyes closed
2. **Tempo**: control your 'horsepower' - swinging in different gears.
    - 20/40/60/80/100% drill again - great for tempo
    - 95-100-105% swings. Hit an iron to your full distance. Now swing a little bit slower to 95%, and then a little bit faster at 105%. Controlling the full swing distance by learning to control the 'little bit slower', and the 'little bit faster'. It will sharpen up your distance control by going 'a little bit over', and 'a little bit under'.
3. **Tension:**
    - Make a swing where you feel zero tension in your arms and shoulders
    - Make a swing where you feel the tension in your neck and jaw melt away
    - Make a swing where you feel all the tension move away from your chest, and entering into the ground – turning your legs into tree trunks

Performance:

Time to test your game in a performance-like manner again! How good are you when you only have ‘one chance’? And when a target & goal are in place? Mimicking on course scenarios and visualizing greens/hazards around the greens to sharpen up even more!

(on course):

- **Try the “3 ball worst ball” drill**: Choose a distance range for 9 holes on the course, such as 110-150m, or 150-190 meters. Drop 3 balls from YOUR distances (write them down beforehand) and putt out (one ball) with the worst of the three. Challenge yourself and track your scores. Can you still score well? Can you still make a par (3)? The more advanced you are: block out the distances that you’re struggling with. If you hit fewer greens than you’d like from 150-180m but are proficient from 100-150m, then create 9 different distances between 150-180m! Create your own ‘par-3 course’, and you’ll be training to perform!

(on range) :

- **Work your way through the bag**: pick a target roughly 30m wide. Hit it in the zone. Start with a pitching wedge, then a 9-iron, all the way down to the driver. If you hit the zone, you can move up a club (from Pw to 9-iron). If you miss the zone at any point, move back a club. Can you finish the drill by hitting that final drive into the zone?

  Advanced: Narrow down the target. Or start again from zero (Pw) at any point of a miss. Whether you’re at a 7-iron or miss the drive, start over to dial up the pressure. And you can’t go home until the mission is complete! Other options are to give yourself ‘X’ lives to complete the challenge. Or to compete with a friend and see who got the furthest within ‘X’ timeframe.

- **Three-in-a-Row**: Hit three shots in a row between two targets. Go through your pre-shot routine. If you miss one, start over again. 3 4-irons between a 20m target, or 3 8-irons between a 12m target, make it difficult and test yourself with a more performance-like drill.

- **Advanced**: Pick a target, the goal is to hit 7/10 for example 8-irons in an 8m wide target. Intensity will grow! Game your wedges to only 4-5y wide. Great exercise to dial in your shorter irons.

APPROACH SHOTS

Mentally trying to bounce each shot off the bottom of the flag. Train to use your wedges as offense. Saving (net) pars, and making (net) birdies. Not everyone can hit 300m bombs, but everyone could become awesome within 100m from the flag. Here it's a game of precision! So practice accordingly.

Technique

Like in the swing, there are many individual tendencies in the wedge game. But two feels I've noticed to help most people are the following:

1) **Rotate around a stable lead side**: set up with the majority of your weight/pressure into the lead foot, 60% / 40% favoring the lead side. And then KEEP IT THERE. We do not need too much shifting in a wedge swing, due to it being more about precision opposed to power. Staying on your left side while you're turning into the backswing will make sure your low point stays consistent and just in front of the ball!

2) Keep the trail side of the body turning through: either use the **Swing Band**, or put something underneath your trail armpit, and focus on keeping that moving. Feeling the connection between the trail arm and trail side of the body. What many people do in these half shots is to just pull the arms down and through, which speeds up the arms, but slows down the body. And with that closes the clubface. So keep the body moving!

Skill

Distance control:

- Control your distances. Learn to write your own distance chart/table, having a certain swing with a certain wedge to land it on a specific number. Do this for distances from 50 all the way to 120 meters. The way to do this is to find a way to control distance. Do you like to work with a clock system: taking it back to for example 9 o'clock, 10 o'clock in the backswing, and through to somewhere similar? Or do you like to take it back to for example chest height, shoulder height, ear height? I like to use my body as a reference as to where I take it back and through – but everybody is different. Take 5 balls to the course (if you have a par 3 course available - even better) from a certain distance, and find out how far you need to take it back and through to carry it on that distance. Write it down, and refine it for all distances - also for your full-swing shots! And for your low shots and high shots. If you're going to take anything from this manual: PERFECT your wedge distance control. Especially for you younger players that want to reach the top. I've neglected it for too long, while it's the key to those low rounds!

Arc/path control:

- Hit 40-80 meter shots out of a (fairway) bunker. Drawing a line in the sand to start your divot on. Do it from different ball positions, and with different tempos. Try to hit them low, high, and medium - try to hit fades, draws, and straight shots if you really want to challenge yourself. Try to hit them with a lot of spin, and try to get some to run out. Try to hit them with a steep angle of attack (deep divot), and a shallow one (shallow divot). If this is too advanced, simply draw a line in the sand and start with hitting the line. Starting your divot in the correct spot. Then do it with a deep and a shallower divot, and watch your strike skills grow!

Performance

- Play the par 3 course (if there is one), try to go as low as possible. Or create your own par 3 course on the big course. Set out different distances in your notebook for 9 holes, and try to either play with one ball only, or play 3 ball worse ball (with the wedge shots only, putt with one ball) - Take note, and see how good you're becoming on your own par 3 course.

  To train even more specifically, if you know from what distances you struggle, pick those distances in your 3 ball worse ball challenge!

How to practice?

If you are aware of the aspects you'd want to improve in your swing and approach shots, make sure you work on it the following way:

Technique:
Split your range balls up in 3 sets of 5. Whether you're working on just one change or two (don't do more if you want to actually improve), doing different sets of 3 x 5 shots will make sure you stay sharp and have 100% of your attention on what you're doing, to make changes in the best way possible. How to split them up?

- **First 5**: exaggerated feels. Exaggerate your swingfeels in both practice swings and the actual swings to bring in more of an actual change.
- **Next 5**: use your swingfeels in different tempos. In slowmotion, half swings, full swings. Mix up your tempo while using your new swingfeel
- **Last 5**: training aid. Use a specific training aid or swingdrill for this block. This will help your mind stay more focused on 'reacting', instead of 'thinking' its way through the move. Learn to react, and learn to play. The game is called golf - not swing!

Be aware of what you want to change and why, then get to it. Focused reps only!

Skill:
Follow it up with specific skill-focused drills to improve the exact part that will help you hit more fairways, more greens, and closer to the flag! If you struggle with strike, focus on the strike skill drill. If you struggle more with clubface angle at impact, focus on the startline control drills. If you struggle with distance control because you're not hitting the ground in the correct spot, work on the groundcontact drills. And for your wedge game, work on distance control! You can never get good enough at these skill based drills. The better you get, the lower you'll score.

Make sure you pay a lot of attention to how everything feels: where that club is moving through impact and how the club is responding to what your body is doing. The more you become aware, the faster you'll improve. If you're 'just hitting balls' without actually paying much attention to what you're doing and what you want to do, you're teaching yourself the wrong habits. Make sure you're fully there in your practice sessions, so your on-course games will be much easier!

Performance:
Finish your sessions off with performance drills, to put your skills to the test. It's a great way to challenge yourself and to see where you're at, so you can evaluate - analyze - and improve some more the next time!

SHORT GAME

Always monitor how the club is interacting with the ground and what you're doing to do that. Understanding what happens and what has to happen. Understand the environment you hit from and to. More freedom in shortgame comes from developing more awareness. Feel the tool in your hand, and know it like it's a part of your body. Earn the skill to play shots: over a period of 18 holes, controlling trajectory, spin, and distances better will give you shorter putts and free you up to aggressively attack pins! And it'll help save those 'easy' up and downs that cost you strokes!

Explore different rhythms. Different grips: grip down or not, weaken the hand or strengthen it. Have the shaft back or lean it forward, hands more up/down? What works best? Find YOUR way, off of different lies. Explore. Teach yourself through education and exploration how to use the ground, how to stick the club into the ground, and how to not stick it into the ground. Just try different things and see what happens. No emotion attached to the outcome, just exploration! How to control the height, how to hit it higher, lower. Practicing off the worst lies you can find. It's all experimentation. Really learn your wedges. Practice being precise. And clean your grooves!

Technique

Shortgame revolves around one very important thing: **low point control**. Anyone that struggles with shortgame, struggles with controlling this exact thing.

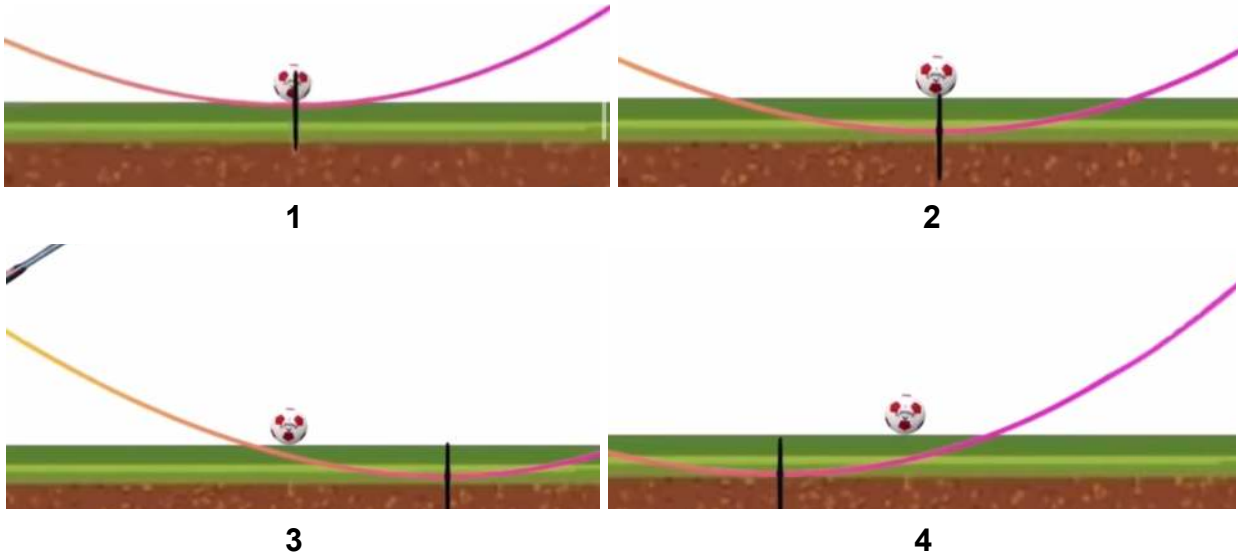

Non-compressed impact

It is not the same as in the golf swing, where we want the lowest point to be in front of the ball, to create a more compressed impact. Having the ball come off flying in shortgame will make it tough to control, hence we'd want to create a more non-compressed impact, with the low point closer to the surface of the ground instead of deeper into the ground.

Compressed impact

The secret to shortgame:

1 2 3 4

Notice the above images: the **pink/black line** intersection is the bottom of the arc, green area the ground and the ball is - the ball. Notice how when you move the arc deeper into the ground (2) the further back the pink line contacts the ground, and then how far forwards everything needs to shift to get contact near the ball (3) . Watch how you can have the lowest point ahead of the ball yet still bury the club behind it! Yet when you raise it up closer to the playing surface, the playable zone becomes wider (1). This is the fundamental that underpins everything in the shortgame.

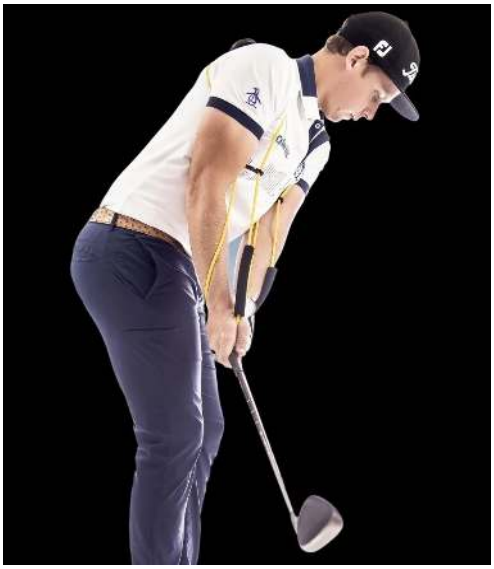

Understand that there are two bits to your 'low point control'. We have the left/right component, your **low point horizontal**. And the up/down component, your **low point vertical** (low point depth).

The reason most people struggle with shortgame, is a lack of control over the latter: low point depth. We enter the ground too deep one time, and don't hit the ground at all the next. This makes the club come through the ball fat one time, and thin the next, making it seem as if you're all over the place. Dropping the arc of your swing too soon and or too deeply into the ground is the death of the short game and the reason why so many struggle. Develop more control over your low point depth, and you'll never struggle again.

For tips on your specific shortgame motion and how to improve your low point depth control (besides the drills below), visit a trusted coach. Note: many coaches are not even very aware of this simple fact above and will say the usual simple things such as 'don't hang back' and 'don't scoop the ball'. I've been through it all before. If you hear those things, without any added information, go somewhere else. You are the CEO of your game after all. Hire accordingly!

Technical drills

1) **GravityFit**: you're going to have to buy this tool if you want to use it. It's called GravityFit. And it's one of the few worthy training aids to have.

It's basically a band that you can put around you like a backpack that will help you stay wide and consistent in your motion. Ideal for improving low-point depth control. Also great to use in the golf swing to teach yourself to stay wide, by feeling that "push out" as opposed to narrowing in transition!

I'm not affiliated in any way. And it's not cheap either. But I've had mine for 3 years already and I still use it. Can only recommend it!

UPDATE: due to the high amount of interest, they offered me a discount code for you to use. Use '**DANE15**' - GravityFit. This does make me affiliated, and it gives you a discount. Either way, it's a great product to improve every part of your game!

2) **Link trail arm to trail ribcage**: put a glove or alignment stick cover underneath your trail armpit. A reason of struggle for most golfers is being too active with the arms on the downswing, and underactive with the body. So instead, try to feel zero participation of the arms coming down, and use the body's turn to bring the arms through. Keep the alignment stick cover/glove connected and focus on keeping that trail ribcage turning.

3) **Lead leg only**: hit shots with your weight on the lead leg only. This ensures you maintain in balance, and turn over that lead side opposed to hanging back etc. Keep that low point in the correct spot and don't lose it by falling back!

4) **Open palm drill**: if you struggle with chipping, good possibility that one of your hands/arm tends to pull on the grip in transition, creating that overactive arms - underactive body that we talked about. Another option could be that the trail arm tends to deepen into the ground by straightening too much compared to where it was at set-up. Opening either the trail hands palm or lead hands palm will ensure that that hand stops 'pulling' and instead coasts along more. Another option is to just chip with the trail arm only! It's a great way to let the club go more opposed to pulling on it! Try to maintain your trail arm 'bend' from set-up to impact and notice the consistency in strike!

5) **Clubpath/strike:** create your own 'path' to swing through to ensure you're making consistent contact with a relatively straight clubpath through the ball. Set up 6 balls like shown below, and start swinging! Similar to Tiger Woods' putting gate drill or the strike drill in the iron section, create a little gate for your chipping motion! (Or use the two alignment sticks like in the iron skill section)

Low point drills:

To improve your shortgame you'll need to start with strike. Improving how you strike the ball is the first step, before moving on to anything else. Use the following low point control drills for it!

- **Coin drill #1**: 2 coins on top of each other. Hit the top coin, and leave the bottom coin to practice your low point vertical (up/down).
- **Coin drill #2**: 2 coins next to each other. Set them up 1 finger width (not length) in between the coins. Hit the front coin (the left one for righties), and leave the back coin, to practice controlling your low point horizontal (left/right)
- **Low point control**: Draw a line in the bunker (or in the grass with a tee). Then just focus on clipping the line on the target side. Try to just brush the grass. Then take a very shallow divot, then a deeper divot. All while hitting the line! Control the entry point!
  Advanced: hit chip shots from the bunker. Picking it clean. Anything slightly off will be shown immediately.

Skill drills:

- **3 ways**: same lie, same target, 3 flights. Get around the green with 3 balls. Hit shots with 3 different flights: low, medium, high, and try to finish close to the flag. You'll have to learn how to change your landing spot, and where to match what flight with. Learn to open up to the different options in front of you and then execute. Which trajectory are you best with? Take note of for example out of 10 different holes, which one on average ends up the closest to the flag?
- **Spins**: high spin, low spin, medium spin. Draw spin, cut spin, neutral spin. Draw spin high spin, draw spin low spin, draw spin medium spin, etc. You get the point. Hit all kinds of shots, with all kinds of spins. This is skill-building to the maximum. Can also do this off different kinds of lies, and see what you prefer most!
- **Landing spot drill**: practice controlling your landing areas. Set up a few clubs in a similar way on the chipping green or at home, and try to land it in the different gaps between the clubs. Set them up as such: starting point = X. I I I I I. Get one in zone 1, then 2, then 3, then 4, without fail, to pass the challenge! Set the ball up at any distance away from the clubs and challenge your landing spot skills!

Advanced skill:

- **Leapfrog testing**: Set up two targets or zones, such as a tee at 5m and one at 15m. Hit one shot just behind the first tee. The next ball you want to hit just past the first ball. Never short of it, because then you'll have to start over, but not too far past it either. The challenge is to get as many shots in from front to back. Never short of the previous one, and not past the endzone. How many shots can you put in between the zone, from a tiny bit further than the previous one to never past the finishing zone? Leapfrogging your way to the end.

  Training to control your speed control in shortgame is absolutely one of the best ways to improve and make more up and downs. Especially those 'simple ones'. Do it from different distances: for example a 5 to 15m zone. A 10-20m zone. A 15-25m zone. Do it with different clubs, with different kinds of shots (low/mid/high). What works best and what brings you the shortest putts in? No guessing, treat playing better golf like a business. What club will you pick on the course for which distances?

Performance:

- **9 up and downs**: set up 6 or 9 up and downs around the green. Decide for yourself: what's the goal? How many out of these do I have to make up and down on? How many shots total as a max? Set that target at the start, depending on your current level, and try to make it through. If you don't get it done, you start all over until you get it done. This drill could take you 10 minutes, or 3 hours. Train your mental fortitude! Or just set a timer and try to get it done within that timeframe. Reward or punish yourself afterward depending on the result, to make it more interesting.

BUNKER PLAY

Train to develop the ability to control the sand. Controlling the sand means you'll be able to hit different kinds of spins from different kinds of lies, by changing the entry point and depth of your divots. Can you hit it properly from all lies, in all kinds of bunkers? Both in firm and soft sand? Being able to adapt needs to be trained!

Similar to the shortgame, the biggest thing to work on is your low point control. From low point depth, to low point left/right. The more/less sand you take will influence how the ball will come out and react on the green. Want more spin? Hit less sand (entry point closer to the ball). If you want more roll-out, take a bit more sand behind the ball!

Two of my best tips to improve bunkerplay are the following:

1) **Set-up & ball position**: slide the lead foot open, and shift the knee towards your toes. This will put 65 to 70% of your weight on the lead side. Focus on staying left, so keep it there! Do not hang back like in the golf swing, but stay turning around a stable left side. Regarding ball position, it differs depending on the shot you want to hit. But as a neutral option, underneath the nipple/midpoint of lead chest has always been my go-to option.

2) **Vertical buttons**: feel the buttons on your shirt staying vertical throughout the shot. Many people struggle in their bunker play because they tend to **tilt** the buttons on their shirt, which moves their low point back! Stay left, and keep those buttons vertical while you turn, and watch your bunker game improve!

Skill:

- **The line**: draw a straight line in the sand. The aim is to start the divot on that line to ensure you develop control of where you're entering the sand! Can you hit the line with both a shallow divot and a deeper divot? Now set up a ball 1 inch in front of the line (left of it, for righties), then see what happens if you hit the line. Then set up a ball 2 inches in front of the line. Then 3 inches. Exploration is the key to improving! What if you hit all these ball positions but take a shallower or deeper divot? See what happens! And learn to control your low point.

- **Advanced:** Work on all shots. A 10-meter high soft shot. Or one that just clears the edge of the bunker: a 1-meter bunker shot. From here, switch to a longer 30m bunker shot. Put yourself through all of them. Even if you're a beginner. Needing to adapt to all kinds of situations will make the 'regular bunkershot' easier! Focus on the clubhead and sand. Don't rush the momentum, and throw the divot of sand to the target. How do they need to match to create the shot you have in front of you? It's skill building, from all lies. Put a whole lot of sand on one little hoop and hit it off there. Now remove a lot of sand and hit it off there. Can you still hit it close? Can you do it off downhill lies too? Explore and develop the ability to use these tools to create all kinds of shots! Play shots from different lies, plugged lies, ball above feet, ball below feet, one foot in bunker, one foot out. Bump it into hills, hit it over, stop it right away. Play around!

Performance:

- Pick a certain distance you want to work on, and see how many you can hit inside a pre-determined zone from that distance. Inside 6ft, or 10ft, challenge yourself to get 7/10 inside the zone, or you can't leave the bunker. Or just take note of how many out of 10 you get!

PUTTING

The final piece to the puzzle and my favorite part of the game. Maybe because I used to suck at it, but turned it into a strength. To improve your putting you need to understand a few things. Much like the golf swing revolves around impact & ball flight, putting is about start line, greenreading, and speed control. Reading the green, then learning to control line and speed is all putting is. There is no one without the other, they have to become ‘one’ for it to work out.

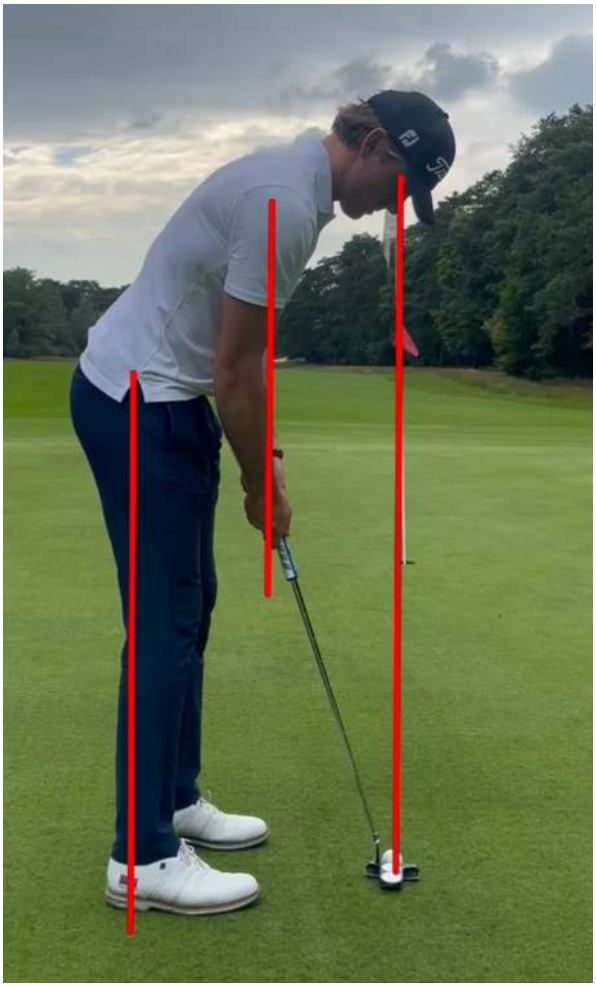

To work on your specific weaknesses and to optimally figure out your own blueprint, get help from a coach (again, find a competent one) or seek help from a putting specialist. You need to do many things right if you want to make more putts. Train to maintain the proper lie angle, loft, face angle, path, length of stroke, acceleration during the stroke, in all kinds of scenarios, while reading the green correctly and matching the speed to the chosen line. There’s a lot that comes to it if you go deep into it. So that’s how you’ll become good at this part of the game! There’s no one-size-fits-all. But I’ll try my best to give you the best tips I’ve been given over the years from some of the best coaches in the world!

Technique:

1) **Set-up**: the key pointers.
    - Ball position underneath the lead eye (to test it: drop a ball from the lead eye and see if it lands on the other ball on the ground) - it's important!
    - Hands hanging directly underneath shoulders
    - Balance more on the middle-to-front part of the feet (NOT on the heels)
    - Set everything up 'on top' of each other. Feet line, knee line, torso, forearms, everything is parallel to the target line. Some may like to open up their feet line to the target a bit, which is a personal preference and it's fine. But the thing that changed everything for me was being sharp on my **shoulder** & **forearm** alignment. Making sure these are parallel to the target line improved my startline control like no other.

Left: everything is parallel to the targetline: feet, knees, hips, shoulders, and forearms!
Right: eyes on top of ball, hands underneath shoulders, balance in a strong and stable position!

2) **The grip:** the putting grip isn't the same as in the full swing. Here we don't need to generate speed, but we need control. Learning how to grip the club in the palm of my hands opposed to in the fingers, helped me start the ball on line a lot more often.

Make sure the side of the grip is following the lifeline of your **lead hand** (left image), and moves through the (palm side) knuckle of the index finger. Many of you hold it in the fingers and have the heel pad of the hand on top of the grip (right image). This makes it harder to control the face angle of the putter throughout the stroke. Hold it more in the palm of your hands and you'll improve your stroke near instantly.

The same thing goes for the **trail hand**: notice the side of the grip touching the lifeline (left image) as opposed to having that lifeline too much on top of the grip (right image).

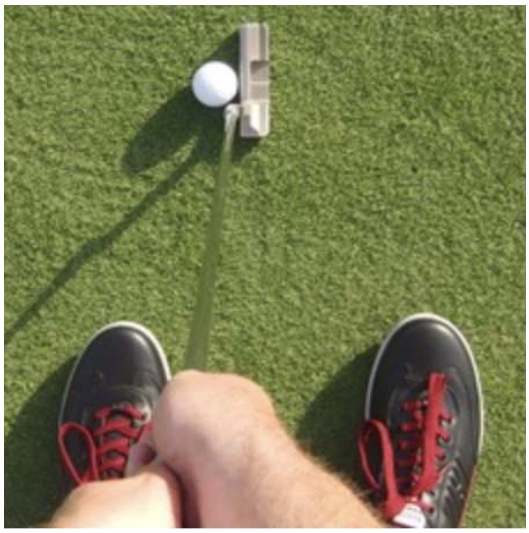

For a better understanding: how to properly grip the putter, just turn down the sound. I don't know what I was thinking there.

A proper grip will also make it a LOT easier to set up with your forearms parallel to the target line, which will always be my **number one key** to improving startline control!

To check your forearm alignment, either record yourself or put a puttingmirror in between your feet and clubhead. You'll instantly see whether your forearms & shoulders are parallel to the rest of the body or not!

3) **Keep it consistent**: one hack to set up the same way every single time is to measure these two things:
    - the distance you stand from the ball.
    - the exact place you like to have your ball position.

How? I like to measure the distance from the right side (from this POV view) of the golf ball directly down to the line my feet are on. Drawing little lines of this exact distance on my alignment stick, so I can measure it out every time I'm practicing.

Next, I measure the distance from the midpoint of my lead foot (top of shoe), to the exact spot on my feetline (right side of ball down to line my feet are on) so I know where my ball position should be at every time.

Measure it all out once you're putting well and you'll have an easier time getting more of those good days! Just make sure you set your balance up in a similar spot every time: I like to feel 55/45 front/back, and 50/50 left/right!

4) **The secret to putting:** we always hear about one of these two things.

    1) Taking it straight back and through
    2) Moving on an in-to-in swing arc.

I never really knew what to do with this, until my coach showed me something 4 years ago that changed my whole understanding of the stroke:

The putterhead - because we're moving on an incline plane - will be moving on an **in-to-in** arc. But the shaftplane is moving **straight back** and **straight through**.

A self-created training aid to work on a straight shaftplane

What I didn't realize is that moving the shaft in a straight line automatically makes the putterhead move in-to-in, due to the **incline plane** that we're moving on. So instead of kind of trying to pull the putterhead in-to-in, let it move in-to-in as a result of you moving straight-to-straight! It's a strange concept to grasp, but it's 100% true.

A slight shift in perspective that brought about a huge shift in outcome. With this drill you'll maintain your lie angle a lot better. You'll be able to easily move your hands straight back and through. And you'll have a much easier time starting the ball on line!

My father helped me create that training aid by simply handing me these:

5) **A stable body**: focus on keeping your body ‘quiet’ while you putt. You don’t want to move all over the place or move your balance left-to-right. Keep your **head still** and stable, then stroke it with your back and core muscles (that’s my feel). A great drill to teach yourself this is to stand on one leg only, and try to remain as still as possible while hitting putts!

6) **Body/arm connection**: you do not want to just make a stroke by pulling the arms back and through, this will make your move very timing-dependent and the inconsistency will inevitably follow. Instead, focus on maintaining the connection in your body and arms. One very simple drill I’ve used for years is to grab something, I use an alignment stick cover or just grab a part of my shirt around the chest area folded together, and stick it underneath the trail or lead armpit. Feel the body and arms moving together!

7) **Wrist angles**: many golfers are very inconsistent in using their wrist angles. Adding loft or de-lofting the putterhead throughout the stroke, instead of simply turning back and through without any added unnecessary movement throughout.

   An awesome tool to build more stability in the wrists is the **Steady Stroke** (left images). This will help your wrists maintain the exact structure you've created from start to finish, for a much more stable clubface in the stroke. A similar drill (less effective, but great feel) is to simply put a ball between your trail wrist and the top of the putting grip (right images). Then focus on maintaining that connection throughout the stroke. Don't let the ball fall, and don't let it get pinched any firmer into your trail arm or putting grip than you had it at set-up! Keep the top of the grip pointing at your belly button throughout the stroke and you'll have a much more solid stroke to build off from!

8) **Arm & shoulder pressure:** A highly overlooked part of better putting is tension levels. We all know it's easier to make a free-flowing stroke when feeling relaxed as opposed to very tense. So bringing awareness to your tension levels has to be a part of your practice sessions. What I want you to try is to relax completely before stepping into a putt, and to keep your arms & shoulder pressure on a 3/10. With 1/10 being extremely loose, and 10/10 being extremely tensed. Let the arms hang, feel loose in the shoulders, and try to maintain that feeling in the whole stroke.

   What I've noticed, especially in pressure situations, is the shoulders tend to get tight, which brings in overcompensations and makes you rush the transition. This won't be very helpful in such a short timeframe. Focusing on loosening up removes all these issues, and brings out the athlete in you.

   Paint that picture with your mind, body, and putter - then let it go!

9) **Tempo**; a consistent tempo will make your speed and startline control A LOT easier. My two favorite things to do to improve tempo are to simply use metronome apps and train on specific beats per minute. Starting the swing off on one beat, moving through the top of the backswing at the next, and hitting the ball at the last beat. Whenever my putting gets off usually my tempo has drifted away from the 'usual' tempo I play at.

   My two go-to apps are:
   a) **Tour Tempo**
   b) **Any metronome app** (this is not the name, just pick any)

   The exact tempo you want to use could be different to mine, but I'm using these:
   - Tour Tempo = short game: 18/9
   - Metronome = BPM: 84

   Find your favorite tempo, and keep it consistent!

   Besides, watch this simple tempo trick from Luke Donald to strike your putts more solidly!

10) **Hammer the nail**: As a follow-up on that video, one tip I want to give you that has made my putting much more consistent is to actually visualize a nail angled through the ball, that you're aiming directly at the target line. Then choose to focus on hitting that nail with a square clubface - to your target. Instead of worrying about 'what if I miss?' or 'I don't trust my stroke', pay attention to hitting the nail to your target. It puts the brain into a more external focus that will help free you up from all the worries. You're giving the brain a clear direction to move towards. The sharper you can see that nail and the more precise you can 'aim' it to your target, the easier it will be to start that ball exactly where you want. Without any added technical thoughts. Try it out! I'm sure it will help you putt a lot more consistently.

Skill

Same as with every part of the game, the more skilled you are with the club in your hands, the lower you'll score. With putting, if you don't develop your skill levels, you'll never play to the level you know you are able to. Since this part of the game matters a LOT. Making those 3-10ft putts, lagging those longer ones close, it'll have a huge impact to your scores.

To become a good putter one needs to become skilled in many aspects. Besides the usual startline and speedcontrol skills, to become advanced one needs to understand how for example different green speeds affect the amount of break you'll need to give certain lengths of putts. The quicker the green, the more break you need to give. The steps to improvement will never end, there's always more to get better and sharper at, whatever level you are currently at!

Here are my favorite skill building drills:

1) **Tigers gate drill**: you've probably seen it before, but simply sticking two tees into the ground just wider than a clubhead width apart is a great drill to consistently strike the sweet spot. If you hit it off the toe or heel and aren't very consistent with strike, the ball will come off firm one time, and dead (due to not hitting the sweetspot) the next. How are you ever expecting to be consistent in your speed control if you don't even hit the sweetspot all the time? Besides, toe strikes can cause too much of a 'push' bias, and heel strikes may bring about more of a 'pull' pattern. So practice it!

2) **Startline control**: create a gate with two tees for the **ball** to go through. Maybe set up a chalk line first on a straight slope so you can easily measure it out. About 2ft from your ball position, set up a gate with the tees to check and work on your startline. Can you get 5 in a row through the gate?

Another option is to simply put a quarter (coin) 3 feet from the ball: can you hit the coin 9 out of 10 times? Then you know your startline control is solid!

3) **Putt to a tee**: to make your practice tougher, start practicing to a tee. Or look at purchasing a 'hole reducer' online. The hole on the course will look a lot bigger! The tougher you make your practice, the easier your play will become. You're literally training yourself to be sharper. Aim here is to hit 10 3-ft putts around a circle, to one tee. Once you hit 8/10, move up a foot and try to complete that level the next time! Train sharp, be sharp.

4) **Ladder drill**: for speedcontrol. Put tees 1 ft apart from each other in a row: I I I I I I I. Set up a certain distance from the tees and try to hit it into the different gaps. Randomized, or sequentially. Can you hit all the zones of the ladder in a row? Do it from different distances - for example 10ft from the starting point, 20ft, and 30ft. Make the gaps between the ladder 2ft wide if it's too difficult at the start. But know that Tiger Woods was literally focusing on front of the cup, center cup, and back of the cup speed. That's the level of control the top guys are at. That can't be controlled with just technique!

Performance

MAKES:

- Make 10x 3 ft in a row. Don't stop until you get it done. If you achieve this level, go to 10x 4 ft putts. Got this? Then to 10x 5 ft putts. Not the same putt from the same spot, pick random putts all across the putting green. Try to do this to a tee, to really tighten up!
- **Advanced**: set up 5 putts around the hole from 4-5-6-7-8 feet, in a spiral. Make all the putts and see how many tries you need. Do this around 4 different holes: for a total of 20 putts. How many can you make? The goal for PGA Tour pros: 16/20.

Speed control:

- 10 two putts in a row from 10-15m: Pick a random putt every time between 10-15 meters from the hole, and try to make a two putt. Do this until you make 10 in a row. Made a three putt? Start over from scratch! Do this whenever you go to a new greenspeed, and you'll adjust yourself in no time!

How to practice?

If you are aware of the aspects you'd want to improve in your shortgame and putting, make sure you work on it the following way:

Technique:
Create your own 'daily homework station': this is your technique. In **shortgame** it could mean using your 3 'staple drills', such as lead leg only - putting something underneath the trail armpit - and using the open palm drill. Work on those in 3 sets of 5 focused reps and do multiple of these! For **putting** it could mean setting up in the exact same spot every time, then using a mirror to check your alignments, and the 'straight shaftplane' drill to stroke it properly. Whatever it is for you, use it as some kind of 'station' that you can get back to throughout your practice session. Whether you need 20 balls to sort yourself out and feel all the right feels, or 100, just go through it! Practicing your 'homework' should be like you brushing your teeth!

In between skill and performance drills, you can go back to this little station. Even if it's for 10 shots - get used to the technical feels you want to implement before moving back to the drills.

Skill:
Pick the skill drills you want to improve on, and start going through them! Similar like in the long game section - try to be sharp and really pay attention to what you're doing. How the club is moving and how you want it to move. Less focus on technique, more on the task at hand! The more you're able to zoom in and pay attention to what you're doing, the faster you'll improve.

Performance:
Finish off your sessions with a challenge/test. Evaluate your game, what could need more improvement? If you have the time available, go back to your technique station to work on that bit, and go through the performance drill again! This way you're actually practicing, and growing your level of play the right way!

PS: Below you will find a few examples of **one hour practice sessions** for you to use! However, it's impossible to make a practice plan that is as useful as possible for EVERYONE due to all of us having different weaknesses/tendencies/availabilities. So if you're really committed, plan out your game - what needs more work - then decide on what you're going to do and how you're going to practice. Create your own masterplan! Because a well structured practice plan is the best training aid you can find!

ONE HOUR PRACTICE SESSIONS

RANGE SESSION #1 - mixed

If you want to know what I do when I only have one hour to practice on the range, here you have it!

Warm-up: 5 minutes. I always hit wedges for about 5 minutes. Starting with shorter shots and gradually work up to longer ones. Then I use an 8-iron (+- 8x), followed by a 6-iron (+- 6x). Just to warm-up and get used to hitting full shots. Takes me about 30 balls in total.

Technique: 15 minutes. 3 sets of 5 shots, repeated twice = 30 balls. Stay sharp and focused. Pay full attention to the technique, not the ball flight!

- **First 5**: exaggerate what you're trying to work on.
- **Second 5**: implement the change into 5 different tempos: 20%-40%-60%-80%-100%
- **Last 5**: Use a training aid to work on your specific move!

Strike: 10 minutes. Use the two alignment sticks drill you've seen before in the iron section. Can you hit the ball without touching the alignment sticks? To practice becoming even more precise, start the swing off from the first alignment stick and re-route the club back to the sweet spot. Start the swing from the back stick and re-route the club back to the middle! Build your skill! +- 20 balls.

Tempo: 10 minutes. 20 balls (4 sets of 5). Take your longer clubs, preferably the driver. You will make swings at 20% tempo, 40%, 60%, 80%, and finally 100%. Try to feel where the club is at in space, and try to hit actual good shots! Do this for a few weeks and you'll hit more fairways than you'll ever have. Swinging in different gears is like controlling the horsepower in your car. Learn to drive in the lower gears when you're practicing and you'll hit more consistent shots when out on the course!

Routine: 10 minutes. Approximately 18 balls: you're going to hit 2 sets of 3x3 shots. This time we're focusing on the routine drills:

- First 3: **Zoom in**. Pick the smallest target possible. Not just 'that tree', but 'that leaf of that branch on that tree'. Hit 3 shots while really feeling like there's no way you can miss that tiny little target. Learning to hit shots while focusing on a tiny target will make you more consistent on the course. Aim small, miss small!
- Second 3: **Commit**. Focus on the smallest target, but now add a sense of 100% commitment to it. The intention here is to make 100% committed swings, where there is no doubt at all. Just a fully committed swing from start to finish.
- Last 3: **Acceptance**. Feel a complete acceptance of any shot that could potentially arise when you're making the swing. This ball could go way right, or way left. Accept it completely BEFORE making the swing, but decide to stay committed to exactly what you want to do, which is making a 100% committed swing to your smallest target. Having this extra level of acceptance before the shot about anything that could happen, being completely cool with any outcome, will give you an even bigger sense of trust in the moment. You'll learn to not be distracted by the 'what ifs', but instead can stay focused on the task!

Repeat this series twice. Switch clubs, switch targets, visualize fairways/greens, and just imagine being out on the course already for the maximum effect

10 Drives: Aim to hit 7 out of 10 drives into a specific zone. If you don't reach the target, start again - but pick a different zone (visualize a fairway!). You can set a timer or again, continue until you succeed. If you succeed, make the zone slightly smaller next time!

It'll be about 140-150 shots hit, and approximately 60 minutes spent practicing wisely! No more wasting time on mindlessly hitting balls, but practicing with a plan instead!

RANGE SESSION #2 - Tee shot focused

Warm-up: 5 minutes. Starting with shorter shots and gradually work up to longer ones. Hit 10 wedge shots. Then 8x 8-iron, followed by 6x a 6-iron. Warm-up and get used to hitting full shots for about 30 balls in total.

Technique: 10 minutes. 3 sets of 5 shots, repeated twice = 30 balls.

- **First 5**: exaggerate what you're trying to work on.
- **Second 5**: implement the change into 5 different tempos: 20%-40%-60%-80%-100%
- **Last 5**: Use a training aid to work on your specific move!

Strike: 5 minutes. Again, use the two alignment sticks drill you've seen before in the iron section. Can you hit the ball without touching the alignment sticks? Build your strike skill and feel over center strikes and a square clubpath! +- 10 balls.

Face strike drill - driver/3 wood: 10 min. Get a whiteboard marker pen and draw a little dot on the ball. Set it up opposite to the target (to the side where club contacts the ball), and hit the shot. Then check on the mark to see where you're hitting the ball on the clubface. Feel the middle and build awareness around exactly where that middle is. Hit 5 shots with the driver, then 5 with the 3 wood. Mix up different targets and ballflights, while trying to strike the sweetspot. Repeat this two times. For 20 shots total.

Driver/wedge: 10 min. Switch hitting two full drives, with hitting two smooth wedge shots. Allow the soft tempo from the smooth wedge shot to be filtered into your driver swing. Learning to swing it, instead of 'hit it'. Repeat this 5 times. For 20 shots total.

5 ball driving game: 20 min. Pick a zone on the range that's good for your level of play (as shown on page 16). You're going to try and hit 5 drives into this target. If you miss at any point, you're going to make a putt (hcp >20 = 3ft, hcp 10-20 = 4ft, hcp 0-10 = 5ft, hcp <0 = 6ft) to either stay on the number that you're at – or start over from scratch. The goal is to finish the drill by ending up at the 5 shots into the zone. It might take a while (set a 15 minute timer if you're in a rush and see how far you've gotten).

Advanced version: As a side-challenge you could also pick a side of the target that is out of bounds, if you miss the target on this side at any point in time you start over completely. If you miss the target on the opposite side (less punishing side) you stay on the number that you're at and try to hole the putt.

RANGE SESSION #3 - irons focused

Warm-up: 5 minutes. Starting with shorter shots and gradually work up to longer ones. Hit 10 wedge shots. Then 8x 8-iron, followed by 6x a 6-iron. Warm-up and get used to hitting full shots for about 30 balls in total.

Technique: 10 minutes. 3 sets of 5 shots, repeated twice = 30 balls.

- **First 5**: exaggerate what you're trying to work on.
- **Second 5**: implement the change into 5 different tempos: 20%-40%-60%-80%-100%
- **Last 5**: Use a training aid to work on your specific move!

Startline drill: 15 min. Set up an alignment stick directly in line with your targetline. About 20ft in front of you. Now set up three balls on either side, with one ball in between (see below).

The aim is to start it over ball 3-2-1 left or ball 1-2-3 on the right. At the start, try to just open and close the clubface so your ball starts a little left, more left, etc. And a little right, more right, etc.
If you start controlling the clubface, try to now change your clubpath while doing it. The eventual goal is to hit different ballflights that end up on your targetline (alignment stick). Hit draws, and fades, to the same target. To make it even more advanced, and to really develop next level clubface control, is to hit mix in low, mid, and high shots while opening and closing the face. Can you hit a low draw and high draw to the same target? Or a low fade and a bigger low fade? If there is one drill I'd want to get good at, it's this one! So practice it, and try to step up the levels.

Ground contact: 15 min. Get in a fairway bunker. Draw a line in the sand. Now hit that line with the divot starting right on it! Or - if you can get on grass only, cut a line in the grass with a tee or pitchfork and do the same. If that isn't possible either, buy a piece of chalk and draw a line on the mat. Then test yourself: can you make good contact from different ball positions, using different clubs? Can you hit the line with a deeper divot, then hitting the line with a very shallow divot?

Work your way through the bag: 15 min. Pick a target roughly 30m wide (add or deduct 5-10 meters depending on your current abilities. Hit it in the zone, starting with a pitching wedge, then a 9-iron, all the way down to the driver. If you hit the zone, you can move up a club (from Pw to 9-iron). If you miss the zone at any point, move back a club. Can you finish the drill by hitting that final drive into the zone?

WEDGE SESSION

Warm-up: 3 min. Loosen up by hitting short to longer shots. Just to loosen the wrists, arms and body and get used to hitting shots.

Technique: 10 min. Focus on your key moves. Preferably using training aids to 'react' to the swingchange opposed to thinking your way through. Technique here is similar to the swing, besides the things you've read hereabove. Rotate around a stable lead side, And feeling a stable release through the ball. Best drill is to use the GravityFit bands to stay wide, while making sure you keep your body rotating through firmly!

Strike: 5 min. Set up two alignment sticks, same as in the iron drills before, and focus on making center strike with your wedges. Feeling a straight path and proper strike is one of the key fundamentals, hence the repetitiveness. Work on it daily!

Distance control: 40 min. Work on your distance control. Use either a clock or body-positioning model. Taking the hands back to for example your chestheight in the backswing. And through to chestheight in the throughswing. See how far the ball carries, and write that down. If you can do this with a launch monitor available, perfect. If you can do this outside on a green (need 50-100m to a green), then that's great too. If all you have available is a range and you are feeling it (and the club allows it), go to the side of the range and set out buckets at 50-60-70-80-90-100m. If that's not allowed or not possible either, just practice the motions and making these swings consistent. Wanting to hit 3 shots in a row as close to each other as possible by using the same backswing and throughswing position. Noting down the estimated distance so you could test it out next time on the course.

If you have a launch monitor or 'buckets to hit to on the range' available), hit 5 shots with these swinglengths:

- Hands to lower part ribcage - to lower part ribcage
- Hands to lower part chest - to lower part chest
- Hands to upper part chest - to upper part chest
- Hands to shoulder - to shoulder
- 3/4 swing
- Full swing

How far does each group of balls carry on average? Note it down. The more you do this, the sharper you'll get, the better you'll become. And it's not just for one day! Do it again and again.

Once you get the hang of it: pick a distance such as 60m, 70m, 80m. And try to hit shots JUST past that distance, but as close to it as possible. So the aim is to hit it at 61/62. Or 71/72. But NEVER short. It's practice, and it requires you to be very sharp in your distance control. Same can be done another day on JUST short, and NEVER long. So 58/59, or 68/69. Work on your distance control, perfect it, and your game will improve like crazy.

I don't even do many performance wedge drills on the range, only on par 3 courses separate to this. But perfecting your distance, that's key. Then test them on the course!

SHORTGAME SESSION #1

A one hour shortgame session: to make sure you stay sharp and improve your shotsaving skills!

Technique: 15 min. Use 3-5 of your favorite drills, such as the ones you read above.

- GravityFit
- Link trail arm to ribcage
- Lead leg only
- Trail palm open
- Through the gate

5 shots each! And go through that 2 times, so 30-50 shots! Really feeling the motion and the effects of it on strike. Try to perfect your technique and strike. Feeling consistent and confident.

3 ways: 20 min. Grab 3 balls and hit shots with different flights, low, medium, high. Go around the green to 5 randomized lies from randomized distances and just try to match the landingspot with the chosen ballflight. Become aware of the strike, of the spin, and of how close you're ending up. The aim is to get all 3 to finish inside Xft (depending on skill level, e.g. 6ft) of the flag. You NEED to keep going until 3/3 are inside of your targetzone! For <0 hcp: 5ft, for 0-10 hcp <7ft, for 10-20 hcp <10ft, for 20-36 hcp <15ft. To make it easier: 2/3 need to be inside of the zone for it to pass. Once it's a pass, continue with the other holes - you completed this one. Keep going until all are complete. Great drill to find your favorites!

Bunker: Technique & skill: 10 min. Draw a line in the sand, so that it can serve as a mark of where you entered the sand. The aim is to make practice swings where your divot starts on the line. Not behind it, not in front of it, but on the line. Keep the buttons on your shirt vertical as mentioned before, then rotate back and through while your body stays on that lead side. Can you hit the line with a shallower divot, and with a deeper divot? Then put a ball about 1-2 inches on the target side of the line and again, hit shots. Can you still enter the line with the ball there? Again, with shallower and deeper divots?

Get in the circus: 10 min. Practice all kinds of shots. From all kinds of lies. Hit shots off a downslope, off an upslope, on a ball above feet where you're trying to swing more around you to shallow out the divot, on a ball below feet where you're swinging more steep! Hit a 3 meter bunkershot, and a 30 meter bunkershot. You need to develop the understanding of how your low point, energy put into the sand, and clubface angle at impact affect the shot you want to play. You'll only learn this by randomizing your practice session like this. Of course, you want to hit all the shots as close as possible, but it's more about figuring things out!

Challenge: 5 min. How many out of 10 shots (normal lie) to a 10-15m pin can you get inside of 4 ft (for <0 hcp), 6ft (for 0-10 hcp), 10ft (for 10-20 hcp), 20ft (for 20-36 hcp) from the flag? Count that up, and try to improve it the next time. Or challenge yourself to get to a certain number before you can leave - this last one is what will really tighten you up. When you HAVE to find a way. Telling yourself you need >5/10 inside of your zone or you can't go home - that's where you'll really find the wins.

SHORTGAME SESSION #2

Technique: 15 min. Use 3-5 of your favorite drills, such as the ones you read above.

- GravityFit
- Link trail arm to ribcage
- Lead leg only
- Trail palm open
- Through the gate

5 shots each! And go through that 2 times, so 50 shots! Really feeling the motion and the effects of it on strike. Try to perfect your technique and strike. Feeling consistent and confident.

Landing spot drill: 15 min. Practice controlling your landing areas. Set up two clubs on the chipping green to serve as a landingzone gap, and try to land it in between these clubs. Set 3 balls up at 5m from the gap, at 10m, at 15m, 20m, 25m. 3 x 5 balls = 15 per test, do it with all three of your wedges. How many can you land in the zone? Depending on your level, make the zone either 1 - or 2 clublengths long. Add up the total you landed within the zone per wedge, and keep note with which one you hit inside of the zone the most!

Leapfrog testing: 15 min. Set up two targets, a tee at 5m and one at 15m. Hit one shot just behind the first tee. The next ball you want to hit just past the first ball. Never short of it, then you'll have to start over, but not too far past it either. The challenge is to get as many shots in from front to back. Never short of the previous one, and not past the endzone. How many shots can you put in between the zone? Leapfrogging your way to the end. The goal is to break your personal best every time you're out training. Great to improve your scoring on the 'simple chips', so you save more shots when out on the course! If you can get it >8, you're already doing a great job. Do it with different clubs, to figure out what works best for you! Same can even be done from bunkers - if you're advanced. How many can you hit in between the zone in a leapfrogging manner? But try that another time.

5 up and downs: set up 5 up and downs around the green. Different shots, from easy, to medium, to hard. Decide for yourself: what's the goal? How many shots total as a max are you cool with? Set that target at the start, depending on your current level, and try to make it through. If you don't get it done, you start all over until you get it done. This drill could take you 10 minutes, or 3 hours. Train your mental fortitude! Or just set a timer and try to get it done within that timeframe.

PUTTING SESSION - #1

Daily homework: 10 min. Whether it takes 20 or a 100 putts, check everything to make sure it's in place! Add or deduct, based on any other technical things you're working on

- Same set-up check: measured out your 'perfect set-up'? Get into it time and time again
- Mirror for shoulderplane & forearm alignment
- Two tees to make center strike
- Plane drill for a straight shaftplane
- Tempo

Chalkline & startline: 10 min. Set up a chalkline on a straight putt if possible, and 2-3ft away from you create a gate for the ball to go through with two tees. Hit putts through this gate. The more advanced you are, the narrower you can make this gate. Working on startline every day will ensure you stay more consistent on the course!

Putt to a tee: 10 mins, 3 x 10 putts. Put a tee in the ground - this will be your target. Go around in a circle, hitting 3ft putts to the tee. How many out of 10 can you 'make'? Repeat it 3x, highest score counts. A simple test: if you got to 8/10 or higher, you've passed the level. Move up to 4ft the next session. I'm stuck at 6ft at the moment. For eight weeks already! The tougher you make your practice, the easier 'play' will become.

Ladder drill: 15 min. Put 6 tees 1 ft apart from each other in a row: I I I I I I. Set up at 10ft from the first tee. Now try to hit it in between the different gaps. Can you get to 5 in a row? From 1-2-3-4-5? This is just practice, focus on getting the right speed. After 5 minutes, move up to 20ft from the tees, and do the same. Randomize the gaps, or hit them sequentially. 5 minutes after, move to 30ft from the tees, now it'll get REALLY tough. It's not really the point if you can hit all the gaps, I can't either, not yet. But practicing this sharp will help you out on the course tremendously. Whatever level you're at - expect more of yourself, and you'll get it more often.

MAKES: 15 min. The aim is to make 10 two putts in a row from 10-15m: Pick a random putt every time between 10-15 meters from the hole, and try to make a two putt. Do this until you make 10 in a row. Made a three putt? Start over from scratch! Do this whenever you go to a new greenspeed, and you'll adjust yourself in no time! If you think this is too hard, just pick a distance you think is manageable: 10 putts from 6m in a row. If you pass that level, move up to 7m. Give yourself a 15 min timer, or keep going until you succeed! Up to you!

PUTTING SESSION - #2

Daily homework: 5 min, check everything to make sure it's in place, then go to the 'half circle'.

- Same set-up check: measured out your 'perfect set-up'? Get into it time and time again
- Mirror for shoulderplane & forearm alignment
- Two tees to make center strike
- Plane drill for a straight shaftplane
- Tempo

Half circle: +-20 mins**.** Create a half circle on a breaking putt, of either 5x 3ft putts, 5x 4ft putts, or 5x 5ft putts. Need to move up the ranks, so start with 3ft. Go into your technique station for 2 or so minutes, then move up to the half circle. Make all the putts in a row. Miss one? Back to the technique station for 2 minutes before you can try again. Keep going until all 5 putts are holed in a row.

4-8ft: 10 min. Set up 5 putts around the hole from 4-5-6-7-8 feet, in a spiral. Make all the putts and see how many tries you need. Do this around 4 **different** holes: for a total of 20 putts. How many can you make? The goal for PGA Tour pros: 16/20. It may be 8 on a good day at the start, and that's completely fine. Keep working on the drills, but now you know what you're working towards.

2 putt challenge: 20 min. The starting point is a 10-meter putt. The aim is to make a two putt. If you make it in two, move up two meters, to 12m. And again, make a two putt. Then move up to 14m. 16m. 18m. Etc. If you miss the two-putt, move back down by 2m. Starting point is 10, can't get lower than that. How far can you go? My record is 28m. Never got to 30! Most putting greens aren't big enough for that either.

If you only have a small putting green available: pick a hole, and put a tee 2ft (3ft if it's too hard for now) behind the cup. The aim is to hit 3 out of 3 putts in-a-row inside of that zone. Miss one of the three, do that level again. Start from 10ft out. Then back up to 15ft. Then to 20ft. Can you make 3 in-a-row from 25 feet? Your putting will never be the same. To make the challenge tougher: do it on different slopes, too. Downhill, uphill, and flat!

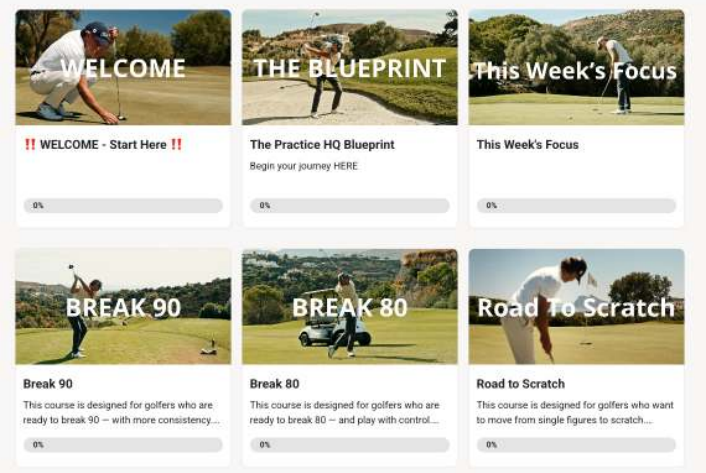

Put it all together

You need to learn how to understand YOUR game. To write out YOUR blueprint. The tendency for most golfers nowadays is to just copy everything they see online, focusing on “the textbook swing”, without any real clarity behind the why’s to it. Instead, go a bit deeper. Which you’re probably already doing if you’ve decided to read through these manuals.

Besides the months I spent writing it all out, it’s taken me thousands of hours on the golfcourse, thousands of hours studying the game, and hundreds of lessons from coaches that have done those exact same things in their lives. The golfing world is still catching up, and I’m sure this is the way that will be taking over within the coming years. Focusing on all aspects of the game, technique - skill - performance, as opposed to just the swing.

Ready for the next step? Inside **The Practice HQ** you get everything you need to keep lowering your scores: swing lessons, practice programs, short game secrets, putting masterclasses and mental game tips. Whatever your level, you’ll learn exactly what it takes to drop your handicap!

The e-books are the introduction. **The Practice HQ** is the program built for more. Looking forward to welcoming you inside:

One last tip: Ask yourself, what would the number one player in the world do every moment you’re in? How would he see the shot? How clear would he be over his intentions? How committed of a swing would he make? Then act like that. Be delusional. It’ll work better than doubting yourself, and the next 10 seconds will pass anyway. You can choose how you use your mind when you play these shots. Use it to produce the best score you possibly can. As that’s what it’s about: **a game of score.** NEVER forget that.

"Don’t play too much golf. Two rounds a day are plenty." – *Harry Vardon*

The end

I hope the information in this book will help put you in the right direction. Exploration is the key to learning. You didn't just learn to walk by watching. You had to go through hours of repetition, falling and standing back up. If you don't practice, you won't develop the skills. The nuances within golf cannot come from reading and theorizing the game: they come from figuring it out yourself. You will not build trust and self-confidence from your chair.

Start analyzing your tendencies, find the missing links between a better game, then fill in the gaps with the drills inside. That's how you're going to improve, and play this game the way it should be played!

PS: For more tips and tricks on how to improve your game that you won't find on my Instagram, subscribe to the YouTube Channel

All the best,
Dane
